

API - Inbound HTTP Interface Specification

v2.0 Apr 2014

This document is intended for technical personnel who wish to receive SMS messages from the DivaTxt platform.

Note that you will need to provide the URL of your webserver to our support team to setup the routing.

The API uses HTTP POST requests to submit messages to a URL on your web server

Fields

Field	Description
sender	This is the mobile number of the senders phone, for the UK this will be in 447XXXX format
message	The full message received including any keyword. This is encoded in UTF-8.
keyword	Just the keyword
recipient	The short code or long number that the message was sent to, e.g. 80010
message_id	A unique ID for this message, to enable you to prevent re-processing the same message.

If your page is down, or unresponsive, we will re-try sending the message several times before giving up.
