

Ethernet

With the ever increasing demand for cost-effective bandwidth and IP related services, Ethernet is becoming the first choice for the provision of bandwidth needs.

If you want secure, reliable and exclusive services then our Ethernet services are the ideal solution.

Ethernet allows you, if you have two or more locations, to seamlessly join your Local Area Networks together.

Key benefits of Ethernet services

- Backed by our Industry leading Service Level Guarantee
- 24 hour network monitoring and fault detection
- A range of bandwidth options, suitable for any business type
- Numerous bandwidth options
- Guaranteed service levels and performance
- Unrivalled availability of service and network
- Secure connectivity
- Various interface options

Assurance

All of our Ethernet services are delivered via a dedicated optical fibre connection – providing you with a secure, reliable and exclusive service.

Bridging the gap

From a geographic perspective, your Local Area Networks are separate, individual entities.

Ethernet links can connect your networks together to allow traffic to pass between sites as if they were based within the same building – with no reduction in performance.

Flexibility

Ethernet connections can be provisioned at a bandwidth suited to meet your current network requirements. As your bandwidth requirements increase in the future, the circuit bandwidth can be increased with little or no disruption to your traffic.

Available bandwidth

Our Ethernet connections offer significant scope and flexibility on bandwidth ranging from 2Mbps up to 1Gbps.

Connecting to the LAN

To ensure your ease of use and peace of mind, we will provide a network interface that is suitable for connection to your equipment.

Predictable costs

Ethernet solutions mean that you will only pay a fixed charge, irrespective of usage. This means budgeting and accounting is simplified and billing can be spread throughout the year.

Additional advantages

Our Ethernet services provide you with the opportunity to reduce the need for on-site servers at remote sites by using Ethernet leased lines to connect sites together.

Regardless of where the host servers are located, applications and services can be provided from a single site to serve the entire network and include:

- Bespoke data file transfers
- Large data and email file transfers
- Fast secure internet connections
- CRM (customer relationship databases)
- Other business critical applications

This can enable easier management, greater efficiency and operational cost savings.
